Object Detection Network -- Yolo V1

Region Proposal → Slow

R-CNN: *Regions with CNN features*

warped region

1. Input image   2. Extract region proposals (~2k)   3. Compute CNN features   4. Classify regions

aeroplane? no.
person? yes.
tvmonitor? no.

CNN

Accurate object detection is slow!

	Pascal 2007 mAP	Speed	
DPM v5	33.7	.07 FPS	14 s/img
R-CNN	66.0	.05 FPS	20 s/img
Fast R-CNN	70.0	.5 FPS	2 s/img
Faster R-CNN	73.2	7 FPS	140 ms/img
YOLO	69.0	45 FPS	22 ms/img

https://arxiv.org/pdf/1506.02640.pdf

With YOLO, you only look once at an image to perform detection

YOLO: *You Only Look Once*

1. Resize image.
2. Run convolutional network.
3. Threshold detections.

Testing an image with Yolo v1

We split the image into a grid
Each cell predicts boxes and confidences: P(Object)
Each cell predicts boxes and confidences: P(Object)

Predict **two** boxes !

No Anchor!

Each cell predicts boxes and confidences: P(Object)

# Each cell predicts boxes and confidences: P(Object)

# Each cell predicts boxes and confidences: P(Object)

Each cell predicts boxes and confidences: P(Object)

Each cell also predicts a class probability.

Each cell also predicts a class probability.

Bicycle

Car

Dog

Dining Table
Conditioned on object: P(Car | Object)
Then we combine the box and class predictions.
Finally we do NMS and threshold detections
This parameterization fixes the output size

Each cell predicts:

- For each bounding box:
  - 4 coordinates (x, y, w, h)
  - 1 confidence value
- Some number of class probabilities

For this dataset:

- 7x7 grid
- 2 bounding boxes / cell
- **16** classes
$7 \times 7 \times (2 \times 5 + 16) = 7 \times 7 \times 26$ tensor = **1274 outputs**

Thus we can train one neural network to be a whole detection pipeline
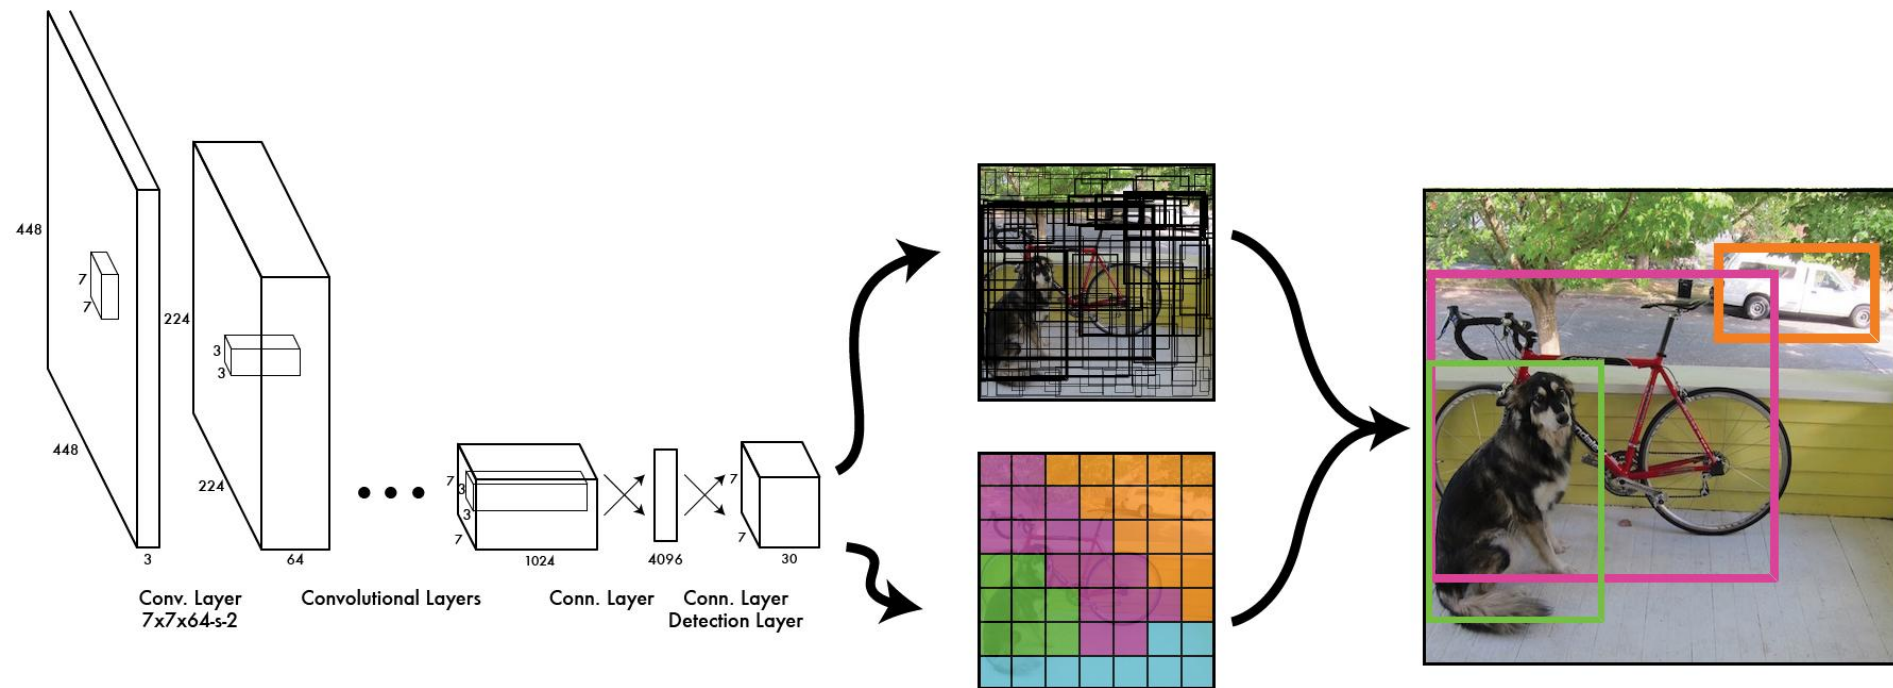

For convenience, we will change the backbone in our homework baseline model.

During **training**, match example to the correct cell
During **training**, match example to the correct cell
We need loss to guide the prediction

Backbone model

The input & output are the same as Yolov1.
But we will use VGG16_bn as out baseline backbone model.
Therefore, we can use Imagenet pretrain model.

What is VGG16_bn

Inside : Conv + bn +relu
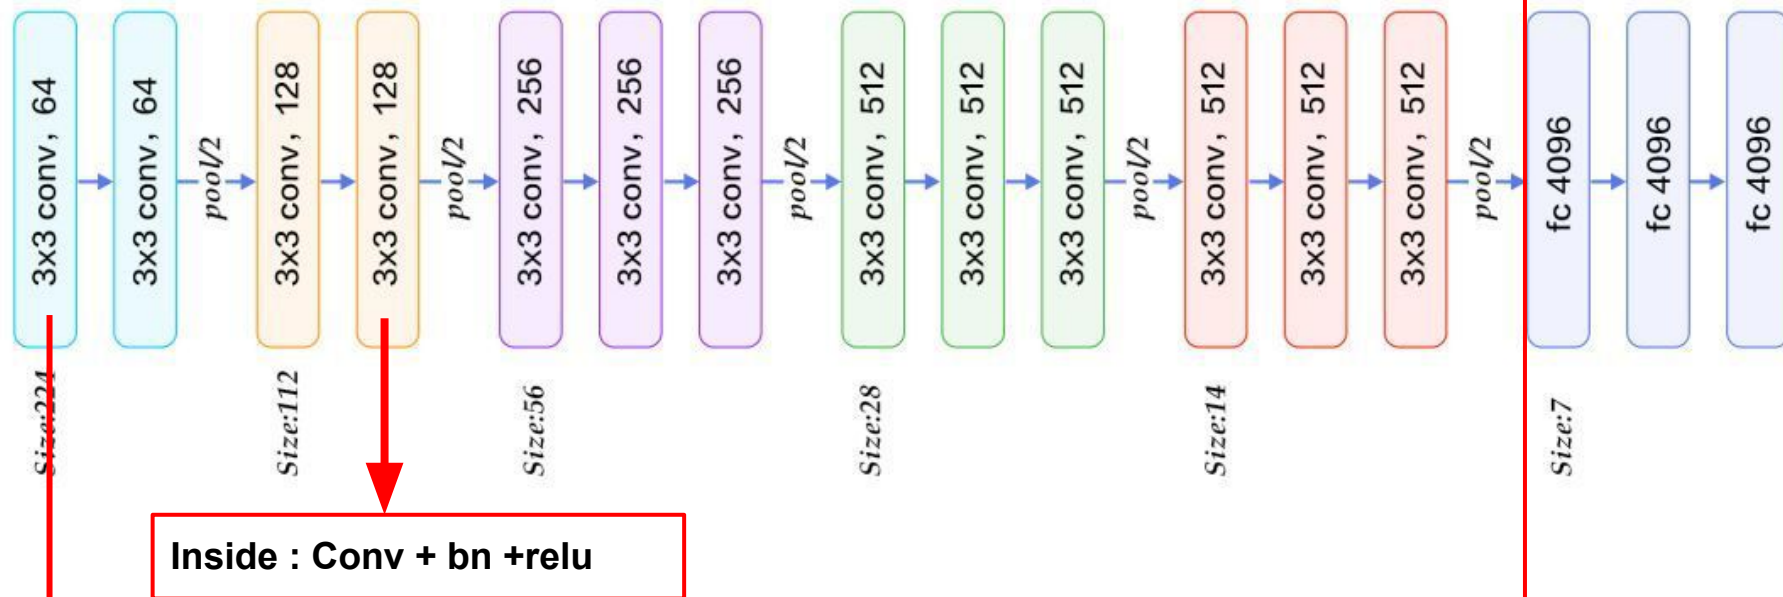

→ We only need this part!

Note ! We made some modification.
Stride=2 for 1st Convolution. (for reduce feature map size)

Don't Worry ~~

We provide the model code (**models.py**) with some "TODO" 🙃

```python
def __init__(self, features, output_size=1274, image_size=448):
    super(VGG, self).__init__()
    self.features = features
    self.image_size = image_size

    self.yolo = nn.Sequential(
        #TODO
    )
    self._initialize_weights()
```

How to use ? Put the code in the same directory, then...

```python
import models

net = models.Yolov1_vgg16bn(pretrained=True)
```

Details of training class & confidence

Implementation Details
IoU

intersection over union

$$IoU = \frac{\text{Area of Overlap}}{\text{Area of Union}}$$
Area of Overlap
Area of Union
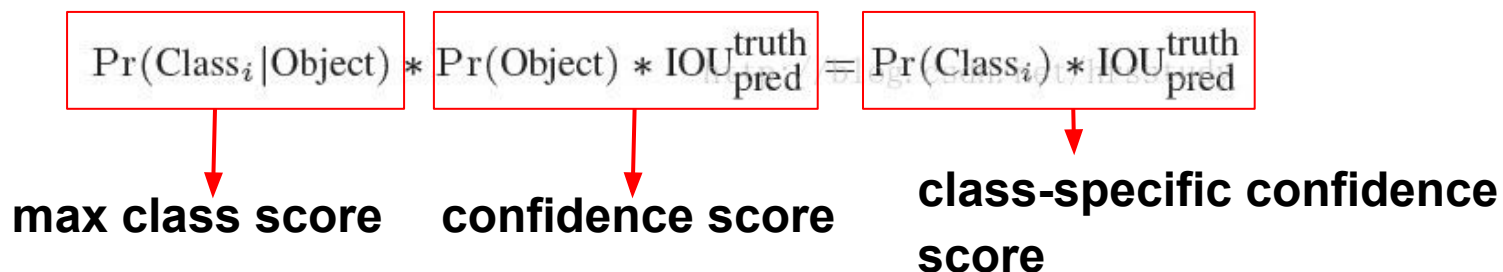

Details of Inference

1. For every bbox, calculate its **class-specific confidence score**.

$$\underbrace{\Pr(\text{Class}_i|\text{Object})}_{} * \underbrace{\Pr(\text{Object}) * \text{IOU}_{\text{pred}}^{\text{truth}}}_{} = \underbrace{\Pr(\text{Class}_i) * \text{IOU}_{\text{pred}}^{\text{truth}}}_{}$$

max class score **confidence score** **class-specific confidence score**

2. We will have 7*7*2 = **98** scores.

3. Use one threshold (maybe 0.1) to filter out the low score detection.

4. Execute Non-maximum Suppression (NMS).

Non-maximum Suppression
Non-maximum Suppression

Why we still keep two anchor boxes of one grid for NMS?
→ One grid may predict **two same class** bboxs with **low IoU**.

Cons : YoloV1 cannot handle two bboxes of one grid with different classes.

- Q & A

TODO

- In this assignment, you will need to implement **two** detection models and provide discussions.

  1. **YoloV1 with VGG16_bn backbone (baseline model)**

     Implement YoloV1-vgg16bn model to perform object detection. The results of this model should **pass** the baseline performance.

  2. **An improved model**

     Implement an improved model. The performance of this model should be better than that of the baseline model. You can change the backbone (Resnet), increase the grid number or choose any model different from YoloV1-vgg16bn, such as Yolov2, Yolov3, SSD, faster-rcnn, etc.

     (You can ask TA if you have some idea but you are not sure whether it is an improved model.)

(xmin, ymin)

(xmax, ymax)

Implementation Details
Class Format

There are 16 classes:

plane, ship, storage-tank, baseball-diamond, tennis-court, basketball-court,

ground-track-field, harbor, bridge, small-vehicle, large-vehicle, helicopter,

roundabout, soccer-ball-field, swimming-pool, container-crane

Implementation Details
Backbone Model -- VGG16_bn

1. **We have to resize the image to 448 x 448**
2. **You have to complete the TODO (or you can just write your own one)**

```python
def __init__(self, features, output_size=1274, image_size=448):
    super(VGG, self).__init__()
    self.features = features
    self.image_size = image_size

    self.yolo = nn.Sequential(
        #TODO
    )
    self._initialize_weights()
```

3. **I have a test example of the model forwarding in my code.**

```python
def test():
    import torch
    model = Yolov1_vgg16bn(pretrained=True)
    img = torch.rand(1,3,448,448)
    output = model(img)
    print(output.size())
```

→ The output should be

```
torch.Size([1, 7, 7, 26])
```

Implementation Details

Model Prediction

You have to parse the annotation file to meet the format of Yolo → (x ,y , w, h , conf. , cls (16-dim))

Implementation Details
Model Prediction -- x & y

Tensor values interpretation

1. x - coordinate of bbox center inside cell ([0; 1] wrt grid cell size)
2. y - coordinate of bbox center inside cell ([0; 1] wrt grid cell size)
3. w - bbox width ([0; 1] wrt image)
4. h - bbox height ([0; 1] wrt image)
5. c - bbox confidence ~ P(obj in bbox1)
x : x-coordinate of bbox **center** inside cell ([0:1] with regard to **grid cell** **size**)
y : y-coordinate of bbox **center** inside cell ([0:1] with regard to **grid cell** **size**)

Implementation Details
Model Prediction -- w & h

- Q & A

Model Evaluation

- Evaluation metric: Choose GT with difficulty = 0 to calculate **mean Average Precision (mAP)**

Precision?

Recall ?

		True Condition			
	Total Population (T)	Positive	Negative		
Predicted outcome	Positive	True Positive (TP)	False Positive (FP) Type I error	Positive predictive value (PPV), Precision $\frac{TP}{TP + FP}$	False discovery rate (FDR) $\frac{FP}{TP + FP}$
	Negative	False Negative (FN) Type II error	True Negative (TN)	False omission rate (FOR) $\frac{FN}{FN + TN}$	Negative predictive value (NPV) $\frac{TN}{FN + TN}$
		True Positive Rate (TPR) Sensitivity, Recall $\frac{TP}{TP + FN}$	False Positive Rate (FPR) Fall-out $\frac{FP}{FP + TN}$	Positive likelihood ratio (LR+) =TPR/FPR Negative likelihood ratio (LR−) =FNR/TNR Diagnostic odds ratio (DOR) =LR+/LR− F_1-score=$2\frac{Precision \times Recall}{Precision + Recall}$	
	Accuracy $\frac{TP + TN}{T}$	False Negative Rate (FNR) Miss rate $\frac{FN}{TP + FN}$	True negative rate (TNR) Specificity $\frac{TN}{FP + TN}$	F_β-score $= (1 + \beta^2)\frac{Precision \times Recall}{(\beta^2 Precision) + Recall}$ $= \frac{TP}{(1 + \beta^2)TP + (\beta^2 FN) + FP}$ G-measure=$\sqrt{Precision \times Recall}$	

Model Evaluation

For a class (ex. Dog), we can calculate its **Precision/Recall** curve with different **confidence score** threshold.

The area under the curve is its **AP** (Average Precision)
precision-recall graph

The average AP of **all classes** is the **mean Average Precision (mAP)** !!

Model Evaluation

- Evaluation : hw2_evaluation_task2.py
  - **We have provided the evaluation script for you**
  - Usage:

    python3 hw2_evaluation_task2.py <PredictionDir> <AnnotationDir>

  - AnnotationDir should be the directory of ground truth dir. (ex. val1500/)
  - PredictionDir should be the directory to put your prediction files.
  - What to put in <PredictionDir>?   Same file name as the GT annotation file !!

Name

0001.txt

0002.txt

0003.txt

0004.txt

0005.txt

0006.txt
Grading Policy

- Baseline (50%)

  - validation set (20%)

  - testing set (30%)

- Report (55%)

Grading Policy

Baseline (50%)

- Implement baseline model **YoloV1-vgg16bn**

- **mAP** score should be above the baseline score

  (valid: 0.086 (8.6%) / test: 0.086 (8.6%))

  - validation set (20%) / test set (30%, only TAs have the test set)

  - Note: baseline credit depends **only on YoloV1-vgg16bn** model.

  - ~~We will announce the baseline score on Fri. (03/29)~~

Grading Policy

Report (55%)   (report template is provided in your GitHub repository)

1. (5%) Print the network architecture of your YoloV1-vgg16bn model and describe your training config. (optimizer,batch size….and so on)
2. (10%) Show the predicted bbox image of "val1500/0076.jpg", "val1500/0086.jpg", "val1500/0907.jpg" during the early, middle, and the final stage during the training stage. (For example, results of 1st, 10th, 20th epoch)
3. (10%) Implement an improved model which performs better than your baseline model. Print the network architecture of this model and describe it.
4. (10%) Show the predicted bbox image of "val1500/0076.jpg", "val1500/0086.jpg", "val1500/0907.jpg" during the early, middle, and the final stage during the training process of this improved model.
5. (15%) Report mAP score of both models on the validation set. Discuss the reason why the improved model performs better than the baseline one. You may conduct some experiments and show some evidences to support your reasoning.
6. **bonus (5%)** Which classes prediction perform worse than others? Why? You should describe and analyze it.

Don't Worry~

We provide the visualization code ><

How to run:

`$  python3 visualize_bbox.py <image.jpg> <label.txt>`

Outline

- Object Detection in Aerial Images
  - Task Definition
  - Object Detection Network (Yolo v1)
- Assignment
  - TODO
  - Implementation Details (Data, Loss, IoU, NMS)
  - Model Evaluation & Grading Policy
- **Deadline & Homework Policy**
- Tutorial & Documentation
- Q & A

Deadline & Homework Policy

- Report and source code deadline : **2019/04/17 (Wed.) 01:00 AM (GMT+8)**

- Late policy : Up to **5** free late days in a semester. After that, late homework will be deducted 30% each day.

- Taking any unfair advantages over other class members (or letting anyone do so) is strictly prohibited. Violating university policy would result in F for this course.
- If you refer to some parts of the public code, you have to put your reference in your report.

- Students are encouraged to discuss the homework assignments, but you must complete the assignment by yourself. TA will compare the similarity of everyone's homework. Any form of cheating or plagiarism will not be tolerated, which will also result in F for students with such misconduct.

Homework Policy - Submission

- Click the following link and sign in to your GitHub account to get your submission repository (if you don't have an account, you need to [create one first](#)):

  https://classroom.github.com/a/EA-0ohqz

  When asked, make sure that you select the correct name/student ID. If you don't find your name/student ID in the list, please [contact TAs](#).

- After getting your GitHub repository (which should be named "hw2-<username>"), be sure to **read the README carefully** before starting your work.

Homework Policy - Submission

- Your GitHub repository should include the following files:
  - hw2_<studentID>.pdf
  - hw2.sh (for running YoloV1-vgg16bn model)
  - hw2_best.sh (for running improved model)
  - your python files (train.py and others)
  - your model files (can be loaded by your python file)
- **<u>Don't upload your dataset.</u>**
- If any of the file format is wrong, you will get zero point.
- If your model is larger than GitHub's maximum capacity (100MB), you can upload your model to another cloud service (e.g., Dropbox). However, you script file should be able to download the model automatically. (Dropbox tutorial: link)

Homework Policy - Bash Script (We only run testing)

- TA will run your code as shown below:

  - bash hw2.sh $1 $2

  - bash hw2_best.sh $1 $2

    - $1: testing images directory (ex. ../test1500/images/)

    - $2: output prediction directory (ex. ./Test_hbb/)

- You **should** generate the prediction files under $2 with the same names of its corresponding images but the extension is ".txt".

- Note that you should **NOT** hard code any path in your file or script

- Your testing code have to be finished in **10 mins.**

Homework Policy - Packages

- Python : 3.5+

- Tensorflow : 1.13

- Keras : 2.2+

- Pytorch : 1.0

- h5py : 2.9.0

- Numpy : 1.16.2

- Pandas : 0.24.0

- torchvision, open-cv, Matplotlib, Scikit-image, Pillow, Scipy, Python standard Lib.

- **E-mail or ask TA first if you want to import other packages.**

Outline

- Object Detection in Aerial Images
  - Task Definition
  - Object Detection Network (Yolo v1)
- Assignment
  - TODO
  - Implementation Details (Data, Loss, IoU, NMS)
  - Model Evaluation & Grading Policy
- Deadline & Homework Policy
- **Tutorial & Documentation**
- Q & A

Tutorial & Documentation

- Yolo v1 paper

  https://pjreddie.com/media/files/papers/yolo_1.pdf

- Yolo 詳解

  https://blog.csdn.net/c20081052/article/details/80236015

- NMS

  https://medium.com/@chih.sheng.huang821/機器-深度學習-物件偵測-non-maximum-suppression-nms-aa70c45adffa

- AP, IoU

  https://medium.com/@chih.sheng.huang821/深度學習系列-什麼是ap-map-aaf089920848

Outline

- Object Detection in Aerial Images
  - Task Definition

- Q & A

Q & A

- If you have any question, you can:
  - Use TA hours (please check course website for time/location)
  - Contact TAs by e-mail (ntudlcvta2019@gmail.com)
  - Post your question under hw2 FAQ section in FB group
  - Useful website: link
  - **DO NOT** directly message TAs (we will ignore any direct message)

Note

1. Be careful about DataLoader
   → You should visualize the bbox and **class** after you parse your data.
2. The decreasing loss may not guarantee that you train it successfully.
3. TA's baseline config.
   a. 1080Ti, Batchsize=16 → 4~6 hours.
   b. GPU Memory : 6GB
   c. training loss : 1~3
   d. Drouput after 4096 FC
   e. lr = 0.001 → after 30 epochs = 0.0001 → after 40 epochs = 0.00001
4. Check your NMS. (visualize before and after)
5. Late policy : Up to **5** free late days in a semester. After that, late homework will be deducted 30% each day.
6. AP of each classes are in next page.

AP of each classes from the baseline model trained by TA.
